

WETTING AGENT / WATER CONDITIONER

General Information

PRODUCT INFORMATION

BufferMate is for improving the effectiveness of pesticide and fertilizer solutions. Many pesticides are more effective and more slowly broken down when applied in acidic spray mixtures. The antioxidant properties of BufferMate will slow down the degradation of some pesticides.

Reducing the pH of mixing water may also reduce the precipitation of fertilizer blends that are incompatible under normal conditions.

Regular use of BufferMate will help avoid buildup of deposits in tanks, lines, etc.

Limitations, Restrictions, and Exceptions

WETTING AGENT / WATER CONDITIONER

Mix 8-64 oz. per 100 gallons final dilution depending on alkalinity of water.

For best results, buffer water with BufferMate and agitate thoroughly prior to adding other materials. Use the minimum required amount of BufferMate, and check the pH of the water to ensure desirable range has been reached. Refer to pesticide labels for optimum pH range. In case all of mix is not used the same day, check pH again prior to use.
