

INSECTICIDES

General Information

GENERAL INFORMATION

SUR-PLUS is a silicone-based non-ionic surfactant / spreader. It is designed for use where maximum spray coverage is needed, or for superior coverage of hard-to-wet targets. SUR-PLUS is highly concentrated and is used at lower rates than conventional surfactants. It is specially formulated to avoid spray droplet run-off that is common with other silicone surfactants. SUR-PLUS has demonstrated excellent plant safety; however, applicators should test a small area before commercial application. While SURPLUS is generally safe, please note that some pesticide treatments that have shown phytotoxicity to plants might be aggravated by use of SUR-PLUS.
