Limitations, Restrictions, and Exceptions

MOLE REPELLENT

APPLICATION DIRECTIONS

Apply when tunnels appear in the area to be treated. To determine if the tunnels are active, flatten an area of the tunnel. If the tunnel is repaired within 1 - 2 days, the tunnels are active.

If the soil is dry, water thoroughly before application.

Rate: Apply at the rate of 2 fl. oz. in 2 gallons of water per 1,000 sq. ft. Shake bottle well and add the desired amount of MOLE REPELLENT to the water in the sprayer. Shake to mix well.

Thoroughly cover the entire area to be treated. Once applied, water the treated area thoroughly to move MOLE REPELLENT into the soil. Repeat when mole activity is noticed.

If this product is packaged in a hose-end sprayer bottle, use the directions indicated in the label.
