

## COMMERCIAL USE

### General Information

Phosphorous Acid products are for use as a supplemental fertilizer treatment. Upon foliar application, the phosphite ions are taken up directly by the plant foliage and may undergo a degree of conversion to phosphate ions, or be used directly by plants, as phosphite ions.

As a soil application to annual crops, a lesser response from the initial crop, with a corresponding superior response from succeeding crops, may be observed. In addition, placement close to seeds or root zones may be injurious to crops. This effect may be aggravated by a soil pH below 6.5

### Limitations, Restrictions, and Exceptions

Rice Starter is designed to supply zinc for newly germinating rice seeds. Add Rice Starter to the normal soaking water at a rate of 1 gallon per ton of seed. Soak rice for the normal time prior to seeding.
