

GROUND APPLICATION

General Information

WashGard is a patented natural coating sprayable onto fruit and trees to enhance rain fastness of copper fungicides. The waxy matrix of WashGard helps to maintain the physical integrity of copper formulations on the fruit surface, making the formulation more durable and resistant to rain wash-off. WashGard does not have any pesticidal activity by itself but extends the activity of copper fungicides it is tank mixed with.

When to apply: Follow instructions on copper fungicide label.

CLEAN-UP: Clean sprayer tank and nozzles immediately after use by adding clean water to the spray tank and spraying the water through the nozzles. If any product has dried on the sprayer, it may be necessary to clean with hot water and detergent.

REMOVAL OF RESIDUES FROM FRUIT: Florida citrus packing-line washer brushes alone may sufficiently remove residues from fruit; however, use of a mild detergent on the washer brushes will aid in removing residues.
