

LOW VOLUME SPRAY

General Information

Sunstream is a spray adjuvant that is especially formulated for low volume foliar applications of herbicides for weed and brush.

Sunstream provides a heavy emulsified spray pattern with larger droplets, better visibility and more efficient herbicide uptake.

Sunstream also helps reduce evaporation loss.

Sunstream can be used in backpack applications, low volume ground spray, rights-of-way, forestry, agriculture and aquatics. With backpacks, recommended spray tips are the Teejet 2503,1504, or adjustable cone jet 5500-X3. Sunstream can be used with any low volume nozzles and is not in violation of any patents.

Limitations, Restrictions, and Exceptions

Use up to 15% to 20% by volume of Sunstream to achieve desired results. Rates will depend on low volume spray equipment chosen.
