

VEGETABLES - TRANSPLANT SOLUTION

General Information

GENERAL INFORMATION

CNI Fast Start is a complete plant food containing NPK and micronutrients and is designed for use as a starter fertilizer in transplant water as well as for foliar application on most crops. It is recommended for use as a readily available source of nutrients to supplement a conventional fertility program – potentially enhancing yield and/or quality by encouraging rapid root development.

CNI Fast Start applied in a program of multiple applications provides a supply of essential nutrients when plant food needs are highest. Adequate plant nutrition, at or near the time it is needed most, assures that the optimum genetic potential will be reached.
