

INSECTICIDES

General Information

GENERAL INFORMATION

CHAMELEON is a self-emulsifiable spreader sticker, surfactant adjuvant designed to improve the efficiency of herbicide, insecticide, and fungicide sprays by increasing contact activity, penetration, and adhesion to plant surfaces. It is formulated nonionic surfactant which has shown excellent synergistic effect with different pesticidal spray solutions.

The unique ingredients in CHAMELEON provide a combination effect of wetting, sticking, spreading, and penetration which vastly improve the effectiveness of fungicides, insecticides, herbicides, or defoliant.

As a general rule, adjuvants are applied to the tank mix; however, since CHAMELEON is self-emulsifiable it can also be incorporated in herbicide or insecticide emulsifiable concentrates for use in low-volume formulations.
