

PESTICIDES INCOMPATIBILITY

General Information

GENERAL INFORMATION

COMPLEMENT is designed to allow pesticides to be mixed that otherwise would separate and form layers.

COMPLEMENT is also intended to reduce the separation or layering of pesticides, that are incompatible with fertilizers such as atrazine or 2,4-D ester. COMPLEMENT, like all compatibility agents, increases the time the incompatible mixture stays mixed. Also, like all compatibility agents, COMPLEMENT works better when added before other ingredients. If COMPLEMENT is added after incompatibility occurs, a higher rate of COMPLEMENT will be required.
