

# **BASAL BARK APPLICATION**

## General Information

### GENERAL INFORMATION

This product is a highly refined emulsifiable petroleum oil to be used as a carrier (diluent) or adjuvant and mixed with oil soluble herbicides for woody plant control in forest and other non-crop sites where diesel oil, fuel oil, kerosene and similar oil carriers or additives are recommended. When used as a carrier or adjuvant, this product will aid in the spreading and penetration of herbicides into bark and stems of woody plants.

### Limitations, Restrictions, and Exceptions

For Basal Bark Applications: This product can be mixed with oil soluble or miscible herbicides and, when allowed by the herbicide label, be used as the sole diluent or carrier to improve spreading and penetration into bark. Thinline, streamline, high and low volume basal bark applications can be made with this product and labeled herbicide mixtures. Suggested mixing rates when used as the sole carrier vary from 1% herbicide in 99% of this product to 75% herbicide in 25% of this product depending on herbicide and method of application. For specific dilution rates consult the herbicide label for the product being used.

Typical applications direct these mixtures onto the lower 18 inches of individual brush and tree stems.
