

APPLES, ETC. (INITIAL TREATMENT YEAR)

Limitations, Restrictions, and Exceptions

Timing

Apply in the spring before the end of May. It is important to apply prior to dogwood borer adult emergence. Consult your local pest control advisor or Pacific Biocontrol representative for proper timing or estimated dispenser longevity in your area.

Note

Isomate DWB suppresses mating of target pest. Immigration of mated female moths of this species from adjacent external sources of infestation will reduce the level of control.

Manage by:

- a. Treatment of external sources of infestation with Isomate DWB.
- b. Treatment of external sources of infestation with an effective insecticide.
- c. Treatment of pheromone treated orchard with insecticide.

Areawide application is most effective. Supplementary applications of insecticide are advised when Isomate DWB is used in orchards with high pest populations or adjacent to orchards with high pest populations. All pests must be monitored so that timely intervention with insecticides is possible.
