

SOYBEANS, COTTON AND OTHER MANGANESE USE CROPS

General Information

General Information

READY-MAN DF is specifically formulated, containing chelated manganese designed to achieve compatibility with Glyphosate and other herbicides commonly tank mixed with Ammonium Sulfate (AMS), water conditioners, or other fertilizer salts. A custom blend of compatibility and chelating agents preserves the efficacy of the herbicide while maintaining optimum availability of the manganese nutrient. Manganese is a micronutrient required by plants for carbohydrate and nitrogen metabolism, as well as for chlorophyll production and maturity. READY-MAN DF is recommended for use on soybeans, cotton, and other high manganese use crops.

Recommended for use on soybeans, cotton, and other high manganese use crops.

Proper timing, rate, and placement is important for desired results and highly dependent on stage of crop growth, soil fertility levels, and environmental conditions. Carefully follow the precautions, restrictions, recommendations use rates and application directions appearing on herbicide labels. Always make a small-scale test (jar test) to assure compatibility in your material.

Manganese does not translocate from old to new growth efficiently, so a second application may be required to achieve desired results.
