

## **CONTROL OF BLUE-GREEN ALGAE**

### General Information

Precaution: Decaying algae can deplete dissolved oxygen which can lead to fish kill, if excessive. Apply with 8 to 10 hours of daylight remaining. Do not reapply within 48 hours. If treating a large lake or heavy bloom, treat 1/3 to 1/2 of the area and wait 2 to 3 days before treating remainder of water.

Refer to the product label for the Water Treatment Maximum Dosage Rate by Volume.

### Limitations, Restrictions, and Exceptions

#### CONTROL OF BLUE-GREEN ALGAE

Apply 3.0 to 100 pounds per acre-foot (9.2 to 306.9 pounds/ million gallons) of water (equivalent to 0.3 to 10.2 ppm hydrogen peroxide) by broadcasting or use of a mechanical spreader.

Note: Algae control is more easily achieved if treated soon after growth starts. Larger amounts of product may be needed to treat heavier blooms. As little as 2.5 pounds per acre-foot could be used for algaestatic treatment.
