

GENERAL USE

General Information

PRODUCT INFORMATION

Use a total of 10-15 gallons per season

The product is designed to provide a safe, soluble and reliable form of calcium ion that may be metered into the irrigation water. The metering process can provide an ease of application of the desired calcium ion necessary to help to provide a cation balance in the soil solution. Unless a nutrient is soluble it maybe unavailable to the plant.

LIQUA-JIP MG may be used to increase the calcium ion in the soil solution. The subsequent addition of Penmax penetrant may help excess salts be carried down through the soil profile.

DIRECTIONS FOR USE

LIQUA-JIP MG should be applied by injecting into the irrigation water. The rate of application should be slow and applied over the entire set. Liqua-jip MG can be diluted with water to achieve this.

It is very important to add LIQUA-JIP MG during the entire irrigation set. LIQUA-JIP MG can be cut with water to create enough volume to treat the entire set.

LIQUA-JIP MG does best when Penmax is added to the irrigation set. Penmax can be added with Liqua-jip MG or on the next irrigation.

Limitations, Restrictions, and Exceptions

GENERAL AG RATES

- With increased calcium ion concentration in the soil solution, this nutrient is made more available for plant uptake.
- A general use rate for LIQUA-JIP MG starts with the first irrigation at 5 gallons per acre. This application will last through 3 irrigations. Apply 5 gallons LIQUA-JIP MG

per acre with each third irrigation until harvest.

- A general use rate over the growing season is a total of 10-15 gallons LIQUA-JIP MG per acre.
