

# 1000 HEAD MATURE DAIRY COWS - WEEK 1-2

## General Information

### MIX WELL BEFORE USING

EnviroLagoon is intended for use to aid in degrading solids, reducing odors and enhancing the handling of most animal wastes stored in lagoon and/or pit systems.

Directions For Use: EnviroLagoon is heavier than water and will act where lagoon solids accumulate. Apply the product at least once per week at the recommended weekly rates shown below. During the first four weeks of use, a shock treatment is highly recommended. Apply this shock treatment to the primary lagoon, then when the primary lagoon is clean or at an acceptable status, maintenance applications may be introduced upstream (i.e. before flush systems or sand / solids reclamation systems). Consult with your Solutions 4Earth representative before changing application method.

EnviroLagoon may be used in concert with anaerobic digestion systems. The product may be introduced into manure before the digestion system to aid in solids removal and/or flowability. EnviroLagoon is recommended to be added two times per week, splitting the weekly rate. In addition or separately, EnviroLagoon may be added after the anaerobic digestion system to treat waste entering the lagoon or flush system.

## Limitations, Restrictions, and Exceptions

Rate: 24 to 30 gallons/week
