

FURROW SOIL APPLICATION

General Information

GENERAL RECOMMENDATIONS

Levesol is formulated for use as an in-furrow fertilizer that can be applied alone or added to other starter fertilizers in cropping systems that benefit from additional nutrient accessibility to the plant. Levesol contains nitrogen from urea and Ortho-Ortho EDDHA.

Ortho-Ortho EDDHA will also form a chelate with micronutrients such as iron, manganese, zinc and copper. This formation of a chelate will minimize the formation of insoluble bonds with phosphate such as zinc phosphate. Levesol should be used as an in-furrow application to any food or fiber crop where increased availability of nutrients in the soil would be beneficial.

INSTRUCTIONS

Refer to your state requirements for specific crop recommendations or use in accordance with recommendations of a qualified individual such as a certified crop advisor, university extension representative, trained agronomist or follow guidelines of an approved nutrient management plan.

Limitations, Restrictions, and Exceptions

-Furrow Soil Application Directions:

Levesol may be applied in-furrow mixed with water or with in-furrow fertilizers as part of a complete soil fertility program. The use rate of Levesol is 64 oz/A. Total volumes of fertilizer or fertilizer and water mixtures are recommended to be 5-6 gal/A to assure maximum distribution within the furrow.

Levesol can be blended with fertilizers and many crop protection chemicals. In the absence of published information, check compatibility by performing a jar test prior to mixing. Add Levesol to liquid fertilizer and agitate mildly until thoroughly mixed. Only mix as much final product as is intended to be used within the day of application. If application is delayed overnight or longer, mixture should be agitated mildly once every 24 hours until applied.

Levesol is a low-salt fertilizer additive that is very safe to the seed. However,

Levesol should not be used in any situation where crop response from starter fertilizers is expected or is likely.

For use in Wisconsin: The Nutrient Application Guidelines for Field, Vegetable, and Fruit Crops in Wisconsin - publication A2809 indicates that Corn will respond to the nutrient found in Levesol. This product is intended for use in mixing and blending with other fertilizer materials, to produce fertilizer whose total primary nutrient guarantees equal or exceed 24%. All nutrients in starter fertilizers are to be counted against the amounts of nutrients recommended based on the crop to be grown and soil test results for all crops in Wisconsin.
