

WHEN SOIL PH LEVEL DROPS BELOW 6.3

General Information

Directions for Use: Apply only as directed. For use on turf and in gardens. The pellets in this product disperse immediately into the soil to reduce soil acidity and bring the soil pH levels into proper balance. When used according to label directions, this product is non-toxic to humans, pets and plant life. For best results, determine the pH levels of the area to be treated by conducting a pH soil test. If that information is not available, refer to the recommendations below on rates and timing.

Gardens have a deeper root zone and require a higher application rate than turf. For best results, double the turf recommended rates and mix into the soil at a depth of 6 inches.

For all applications: Immediately after application, apply a minimum of 0.5 inches of water to disperse particles into the root zone. Due to variations in temperature and water pH, best results are achieved by splitting the irrigation into 2 applications at 10-15 minutes apart. This will allow for more thorough particle dispersion into the root zone.

For incorporation, after application, wet thoroughly 30 minutes before tilling.

Limitations, Restrictions, and Exceptions

To maintain proper pH soil levels, repeat application 1 to 2 times per year, or when the soil pH level drops below 6.3, at rates of 4-6 lbs. per 1,000 sq. ft.
