

NONIONIC WETTER/SPREADER SURFACTANT - FOR USE WITH FLOOD OR OVERHEAD IRRIGATION WATER

General Information

GENERAL INFORMATION

AD-SPRAY 101 is a specially formulated non-ionic wetter/spreader surfactant. ADSPRAY 101 is designed to improve the application efficiency of pesticide sprays by modifying contact, wetting and spreading of the sprays and can be used with a broad range of equipment. Optimum application effects, however, can be influenced by the crop, pest, spray equipment, spray volume, pressure, droplet size, spray mixture and environmental factors. Consequently, it is recommended that careful observation of the spray deposit be made and adjuvant concentrations be adjusted accordingly.

Limitations, Restrictions, and Exceptions

DIRECTIONS FOR USE

The addition of an adjuvant to some pesticides or pesticide tank-mix combinations may cause phytotoxicity to the foliage and/or fruit of susceptible crops. Prior to the addition of AD-SPRAY 101 to spray tank-mixes, the user or application advisor must have experience with the combination or must have conducted a phytotoxicity trial.

AD-SPRAY 101 can be applied with ground, aerial or CDA spray equipment. For most applications, use enough AD-SPRAY 101 to allow for uniform wetting and deposition of the spray onto leaf and stem surfaces without undue runoff.

For use with flood or overhead irrigation water:

For flood irrigation, make a solution of 1 pint per 100 gallons of spray and apply the solution over the soil surface, spraying wet. For overhead irrigation, add AD-SPRAY 101 directly into the irrigation water from a calibrated injection system. Use 1 pint per 100 gallons of water.

NOTE: The above use recommendations are considered to be adequate for most uses. Some pesticides, however, may require higher or lower rates for optimum effect. Follow the pesticide label directions when this occurs.
