

# POTATOES

## General Information

### GENERAL USE INSTRUCTIONS

For best results, X- CYTE should be applied before noon or after 4 p.m. a spreader-sticker (surfactant) cleared for application to growing crops should be used with the product. Store X- CYTE in a cool place and out of direct sunlight. Any spigot or pump put into an X- CYTE drum should be cleaned with disinfectant (bleach and water, etc.) before using, unless the whole drum is to be used at one time. Mix X- CYTE with enough water to get thorough coverage of plant surfaces. X- CYTE is compatible with most other spray materials.

### Limitations, Restrictions, and Exceptions

## POTATOES

1st application: at tuber set. The time of application is determined by pulling an average size plant in the field 4 weeks (and every 7 days thereafter if necessary) after planting. Observe the roots to see if tubers are forming. Anytime you see the small tubers forming, it is time for the

1st application. Usually tubers start to set 5 to 6 weeks after planting.

2nd application: at full blossom. Russet Burbanks, which do not show full blossom, should be sprayed 2-3 weeks after 1st spray.
