

INFIELD APPLICATION

General Information

GENERAL INFORMATION

INFIELD is a convenient, ready-to-use spray additive and is intended for use with herbicides that recommend the addition of Ammonium Sulfate to the spray solution. Uptake is enhanced by the ammonium ion source. INFIELD also increases efficiency by improving drift control characteristics and deposition of the spray solution. Sound application technology and procedures must be followed when applying pesticides. INFIELD is compatible with most pesticides. INFIELD buffers spray solutions to prevent hydrolysis and ties up antagonistic ions found in hard water. Always use this product in accordance with instructions concerning adjuvants contained in the pesticide label.

Directions For Use

For the addition of 8.5 pounds of Ammonium Sulfate per 100 gallons of spray solution, add one 2.5 gallon container of INFIELD per 100 gallons, or 2.5% v/v. INFIELD contains the proper amount of Deposition Aid and Defoamer for use at this rate.

Always add INFIELD to the spray solution first, to allow it to buffer hard waters, before the addition of pesticides. Add pesticides to the tank in the sequence recommended on the pesticide label.
