

FOLIAR SPRAY APPLICATION - TREE CROPS

General Information

General Information:

KEYLATE Super Starter is for soil and foliar application. It is readily available and rapidly absorbed by the root system of foliage.

KEYLATE Super Starter is formulated to be used in fertilizer solutions. Broadcast or row applications are acceptable, although greater efficiency may be expected from row applications. Micronutrient deficiencies usually occur when plants are small; therefore, micronutrients should be added to the fertilizer at or before planting.

Limitations, Restrictions, and Exceptions

FOLIAR SPRAY APPLICATION - TREE CROPS:

If concentrated spray is used, increase the concentration in direct proportion to dilution. If tree crops are sprayed several times a year, the above amount can be split into more numerous applications.

Foliar fertilization is intended as a supplement to a regular fertilization program and will not, by itself provide all the nutrient normally required by agricultural crops.

When foliar spraying KEYLATE Super Starter through a conventional sprayer, use a minimum of 20 gallons of water per acre (180 liters per hectare). When foliar spraying KEYLATE Super Starter with low volume equipment, 5 gallons of water per acre (45 liters per hectare) is usually sufficient. If less water is used, slight burning of the foliage may occur. A maximum of 0.5 gallons per acre per application is recommended. Aerial applications should not exceed 1 quart per gallon (1 liter per 4 liters) of water.

The addition of 0.5% (total solution) of nitrogen solution, ammonium sulfate, or L.B. Urea may aid leaf absorption.
