

WARM SEASON TURF

General Information

GENERAL INFORMATION

LINK-M7 is a specially blended chelated liquid turf micronutrient product that promotes surface density and development of full root systems for stronger, more vigorous turf. It also contains humic acid from natural humates, which may increase the availability of micronutrients.

LINK-M7 provides a fast method to boost plants during stress because of micronutrient deficiencies. The magnesium, iron, and zinc supply essential elements for activating plant enzyme systems and photosynthesis. Because these micronutrients are chelated with citric acid, nutrient availability and uptake by plant and roots are enhanced.

LINK-M7 is nonphytotoxic when used as directed.

LINK-M7 should be used as part of a comprehensive Total Nutrition System® for optimizing plant growth, development, yield and quality.

Limitations, Restrictions, and Exceptions

Do not apply when plants are under excessive heat or moisture stress. Applications of foliar nutrients to leafy vegetables or soft-skinned fruits during periods of excessive temperatures may cause cosmetic injury. Applications of certain micronutrients to fleshy fruits within 30 days of harvest may result in staining of rind or skin.
