

SOIL APPLICATION - MODERATE (BROADCAST)

General Information

CITRI-CHE Iron 5% contains 5% chelated iron in a form readily available to plants. It is recommended for use as an additive in liquid fertilizer and can also be used as a foliar spray. CITRI-CHE Iron 5% is compatible with herbicides, insecticides, and most agricultural chemicals that may be utilized in combination with liquid fertilizer. CITRI-CHE Iron 5% is most effective when placed in the root zone during planting or moved into the soil by irrigation, tillage, or rainfall. It is important that the iron deficiency be treated before visual symptoms appear to insure proper yields. Rates of application will vary depending upon the severity of the deficiency, climate, soil conditions, and method of application.

Limitations, Restrictions, and Exceptions

Soil application: CITRI-CHE Iron 5% can be applied in water or in combination with liquid fertilizer for pre-plant, starter, or side-dress applications. The most effective treatment of row crops is soil applications in a band at planting time or as a side-dressing shortly after planting. For dry fertilizer applications, use Winfield LS granular micronutrients.
