

FOR LOW VOLUME SPRAYING

General Information

GENERAL INFORMATION

COMPLEX is a self-emulsifiable spreader/sticker, nonionic surfactant adjuvant designed to improve the efficiency of herbicide, insecticide*, and fungicide* sprays by increasing contact activity, penetration, and adhesion to plant surfaces. COMPLEX can be used on food and feed crops, and non-crop areas such as rights of way, industrial, forestry, etc.

COMPLEX's surfactant action helps to keep the solution in suspension and reduces surface tension to give the spray a more uniform coverage. COMPLEX also increases the penetration of the leaf wax to increase the penetration of the chemical.

Note: Not for use in combination with insecticide or fungicide sprays in California.

For Terrestrial Use Only – Not For Aquatic Use

Limitations, Restrictions, and Exceptions

FOR LOW VOLUME SPRAYING:

Add COMPLEX to the spray tank with good agitation after all other spray materials have been added.

Aerial Application: When applying aurally, follow pesticide label directions including minimum water volume per acre. Do not substitute COMPLEX for water required by the pesticide label.
