

# **TURF**

## General Information

PRO-MATE Power Verde Fertilizer is a blend of micronutrients - iron, manganese, zinc and copper and secondary plant nutrients, magnesium and sulfur. The micronutrients in this product are derived from sulfates and metals. As part of a regular fertilizer program, this product may further enhance resistance to environmental stress and aids in the prevention and correction of micronutrient and secondary plant nutrient deficiencies.

PRO-MATE Power Verde Fertilizer is designed to be mixed with soil or soil-less growing media in horticultural applications. It is to be applied in a single treatment and should not be applied a second time or applied to media where other micronutrient products have been applied.

PRO-MATE Power Verde Fertilizer is intended to be a supplement to a normal fertilizer program where nitrogen, phosphorous and potash only are being applied.

## DIRECTIONS FOR USE

This product can be applied to the following crops: Ornamental crops, greenhouse plants and turf grass. Rates and timing of applications are dependent on local conditions and should always be made as a result of soil and/or plant tissue analysis and in conjunction with advice from your local agricultural authority.

1. PRO-MATE Power Verde Fertilizer should be pre-incorporated at a rate of 2.0 - 4.0 lbs. per cubic yard during mixing for all plants grown in soil-less media.
2. When upshifting to larger containers, application rate only applies to incremental growing media used.
3. For maximum results, PRO-MATE Power Verde Fertilizer should be the sole source of micronutrients and should not be used with any other micronutrient products or fertilizer mixtures containing significant amounts of micronutrients.

4. Calcium (Ca) is included in PRO-MATE Power Verde. If the pH of the growing media and the pH of the irrigation water indicate the need, calcium should be provided from other sources. Do not pre-mix PRO-MATE Power Verde with lime.
