

SHADE TREES

General Information

DESCRIPTION

Winterizer is a premium quality homogeneous fertilizer product of Nitrogen, Phosphate and Sulfur. All of these are formed into a homogeneous pellet that is dust free and gives more uniform distribution of Primary, Secondary Nutrients. It is not merely a blend of several different materials, hence with homogeneous fertilizer there is no segregation.

Limitations, Restrictions, and Exceptions

DIRECTIONS FOR USE

SHADE TREES

Make first feeding in late winter or early spring before new growth starts. Second feeding should be made about the last of May or first of June. The third, and final yearly feeding should be made during the last of August or the first of September. Apply 1lb. Per 3 feet of height to maximum of 6 lbs. per tree.

Spread the fertilizer out and around the tree drip line, and do not apply close to the trunk area. Wait one year before fertilizing newly planted trees as usually their root system are concentrated in a small area, and subject to burning if too much fertilizer is applied
